types

Definition (Mikado braids)

We define *Mikado braids* by induction on n as:

1. The trivial braid in \mathcal{B}_1 is a Mikado braid,
2. A braid $\beta \in \mathcal{B}_{n+1}$ is a Mikado braid if there exists a braid diagram for β with a strand lying above all the other strands, and such that removing this strand yields a braid $\beta' \in \mathcal{B}_n$ which is Mikado.

Definition (Mikado braids)

We define *Mikado braids* by induction on n as:

1. The trivial braid in \mathcal{B}_1 is a Mikado braid,
2. A braid $\beta \in \mathcal{B}_{n+1}$ is a Mikado braid if there exists a braid diagram for β with a strand lying above all the other strands, and such that removing this strand yields a braid $\beta' \in \mathcal{B}_n$ which is Mikado.

- ▶ If $\beta \in \mathcal{B}_{n+1}$ is Mikado, then it can be shown that removing *any* strand lying above all the others in *any* braid diagram for β will yield a Mikado braid in \mathcal{B}_n .

- ▶ In the above list, every braid is Mikado except the last two ones.

Examples and questions

- ▶ Take the reduced expression $s_1 s_2$ of $(1, 2, 3) \in \mathfrak{S}_3$. All possible ways to lift this reduced expression in \mathcal{B}_3 in square-free braids are: $s_1 s_2, s_1^{-1} s_2, s_1 s_2^{-1}, s_1^{-1} s_2^{-1}$. All of them are Mikado.
- ▶ Take the reduced expression $s_1 s_2 s_1$ of $(1, 3) \in \mathfrak{S}_3$. All possible ways to lift it in square-free braids are:

$$s_1 s_2 s_1, s_1^{-1} s_2 s_1, s_1^{-1} s_2^{-1} s_1, s_1^{-1} s_2^{-1} s_1^{-1}, \\ s_1 s_2 s_1^{-1}, s_1 s_2^{-1} s_1^{-1}, s_1^{-1} s_2 s_1^{-1}, s_1 s_2^{-1} s_1.$$

- ▶ In the above list, every braid is Mikado except the last two ones. To all the Mikado ones corresponds a mixed braid relation. **Example:** $s_1^{-1} s_2^{-1} s_1 = s_2 s_1^{-1} s_2^{-1}$.

algebras

Proposition

Let $s_{i_1} s_{i_2} \cdots s_{i_k}$ be a reduced expression of $x \in \mathfrak{S}_n$. Let $\beta = \mathbf{s}_{i_1}^{\varepsilon_1} \mathbf{s}_{i_2}^{\varepsilon_2} \cdots \mathbf{s}_{i_k}^{\varepsilon_k}$, $\varepsilon_j = \pm 1$, be a lift of x . Assume that β is Mikado. There is a bijection between the reduced expressions of x and those of β ; i.e., whenever we apply a braid relation in a reduced expression of x , there is a corresponding mixed braid relation which can be applied in the lifted reduced expression of β . In particular, **every** reduced expression for x can be lifted as above to a word representing β .

Mikado braids in Artin-Tits groups

Topological models in the classical types

Example

The transposition $(1, 3)$ has two reduced expressions $s_1 s_2 s_1$ and $s_2 s_1 s_2$. The braid $\beta = \mathbf{s}_1^{-1} \mathbf{s}_2 \mathbf{s}_1$ is Mikado. It is also equal to $\mathbf{s}_2 \mathbf{s}_1 \mathbf{s}_2^{-1}$. The braid $\beta = \mathbf{s}_1^{-1} \mathbf{s}_2 \mathbf{s}_1^{-1}$ is not Mikado. There is no lift of $s_2 s_1 s_2$ which is equal to β .

Let $x, y \in \mathfrak{S}_n$.

1. *The element $x_{N(y)}$ is well-defined. In particular, it is independent of the reduced expression we chose for x and $x_{N(y)}$ satisfies Matsumoto's Lemma: distinct lifted reduced expressions of x yielding $x_{N(y)}$ can be related by a sequence of mixed braid relations.*
2. *We have $(xy^{-1})_{N(y)} = \mathbf{xy}^{-1}$.*

Proposition (Dyer, unpublished)

Let $x, y \in \mathfrak{S}_n$.

1. *The element $x_{N(y)}$ is well-defined. In particular, it is independent of the reduced expression we chose for x and $x_{N(y)}$ satisfies Matsumoto's Lemma: distinct lifted reduced expressions of x yielding $x_{N(y)}$ can be related by a sequence of mixed braid relations.*
2. *We have $(xy^{-1})_{N(y)} = \mathbf{xy}^{-1}$.*

Corollary

A braid $\beta \in \mathcal{B}_n$ is Mikado iff there are $x, y \in \mathfrak{S}_n$ such that $\beta = x_{N(y)}$.

The Tits representation: a tool for the study of a Coxeter group

- ▶ There is a canonical bijection between Φ^+ and the set $\mathcal{T} := \bigcup_{w \in W} wSw^{-1}$ of *reflections* of W , given by

$$wsw^{-1} \mapsto \pm w(\alpha_s) \cap \Phi^+.$$

Hence we can talk about (bi)closed sets of reflections.

- ▶ Let $y \in W$. Set $N(y) := \{t \in \mathcal{T} \mid \ell(ty) < \ell(y)\}$ (the *left inversion set* of y). It can be checked that $N(y)$ is biclosed and that every finite biclosed set $A \subseteq \Phi^+$ is equal to $N(y)$ for some $y \in W$.

Proposition (Dyer, unpublished)

Let $x \in W$. Let $A \subseteq \Phi^+$ be biclosed. Let $s_1 s_2 \cdots s_k$ be a reduced expression of x . Define

$$x_A := \mathbf{s}_1^{\varepsilon_1} \mathbf{s}_2^{\varepsilon_2} \cdots \mathbf{s}_k^{\varepsilon_k},$$

where $\varepsilon_i = -1$ if $s_k s_{k-1} \cdots s_i \cdots s_{k-1} s_k \in A$ and 1 otherwise. Then x_A is well-defined and one passes from any reduced expression of x_A to any other by applying a sequence of mixed braid relations.

Definition (Mikado braids in Artin-Tits groups)

Let W be a Coxeter group. We say that $\beta \in B(W)$ is a *Mikado braid* if there is $x \in W$ and a biclosed set $A \subseteq \Phi^+$ such that $\beta = x_A$.
