Let W be of type A_{2n-1} and let Γ be the automorphism of W induced by $s_i \mapsto s_{2n-i}$ for all $i = 1, \dots, 2n-1$. It induces an automorphism Γ of $B(W)$. The subgroup $B(W)^\Gamma \subseteq B(W)$ of fixed points under Γ is isomorphic to $B(W^\Gamma)$ and W^Γ is of type B_n . It consists of braids on $2n$ strands which are fixed under the automorphism $s_i \mapsto s_{2n-i}$ (“symmetric braids”).

Theorem (Digne-G., 2015)

Let $\beta \in B(W^\Gamma)$. The following are equivalent

1. The braid β is a Mikado braid.
2. There is an Artin braid in $B(W)$ representing β , such that one can inductively remove pairs of symmetric strands, one of the two strands being above all the other strands (so that the symmetric one is under all the other strands).

Topological models in the classical types: type D_n

- ▶ Take the Artin group $B(W^\Gamma)$ of type B_n , topologically represented by symmetric braids. The generator $\mathbf{s}_n \in B(W)$ lies in $B(W^\Gamma)$. Let \overline{B} be the quotient of $B(W^\Gamma)$ by $\mathbf{s}_n^2 = 1$ (“allow to invert middle crossings”).

Lemma (tomDieck '98, Allcock '02, Baumeister-G. '17)

Let W' be a Coxeter group of type D_n . Then $B(W')$ can be realized as an index two subgroup of \overline{B} . In particular, elements of $B(W')$ can be represented topologically.

Spherical Artin-Tits groups are Garside groups

Definition

A *Garside group* G is the group of (left-)fractions of a Garside monoid (M, Δ) .

- ▶ Let (W, S) be a finite Coxeter system with Artin-Tits group $B(W)$. Let $B(W)^+$ be the *positive braid monoid*, defined by the same presentation as $B(W)$ (but as monoid).

Fact

Every finite Coxeter group has a unique element w_0 of maximal length. Write Δ for the canonical lift of w_0 in $B(W)^+$.

Theorem (Garside, 1967)

The Artin-Tits group $B(W)$ is a Garside group, with corresponding Garside monoid $(B(W)^+, \Delta)$ and we have $\{\text{Div. of } \Delta\} = \{\mathbf{x}, \mathbf{x} \in W\}$.

algebra

About the proof that s.d. braids are Mikado

- ▶ The idea of the topological proofs is elementary. If $W = \mathfrak{S}_n$, starting from the noncrossing partition corresponding to $x \in P_C$, there is a rule to read an Artin braid representing x_C . Properties of this braid can be read directly on the noncrossing diagram, in particular the Mikado property.
